

Map interpretation note

This map was developed specifically for the Wetland Vision Technical Document

Wetland Vision map of action for ponds for England

Ponds are easier to establish and sustain where there are soils that naturally hold, or will impede the flow of water. They tend to be in higher densities in these areas too, but ponds exist and can be created all across England. This map shows the distinction between these areas, and is based on a combination of soils that are of similar drainage characteristics. Local conditions will determine how important pond creation could be.
